

Amendment to the Abstract:

Please amend the Abstract as set forth below

A lens-attached light-emitting element having an improved optical availability efficiency ~~is provided. A~~includes a composite lens ~~is provided on an approximately U-shaped light-emitting area of a~~the light emitting element array. ~~A U-shaped polygonal line consisting of three segments is imagined when the positions where light intensity is maximum in the approximately U-shaped light-emitting area are fastened. Four parts of spherical lenses are arranged in such a manner that each center thereof is at the both ends of~~is centered in the neighborhood of the both ends~~an end of a~~ respective one of three segments of ~~the a~~a U-shaped polygonal line corresponding to positions where light emitted by the U-shaped light-emitting area is a maximum; ~~the~~Three parts of cylindrical lens are arranged between two ~~parts of the~~ spherical lens, respectively, each ~~part of~~ cylindrical lens having an axis parallel with each segment. These four ~~parts of~~ spherical lenses and three parts of cylindrical lenses are ~~neighbored together to constitute the composite lens. The light-emitting element further comprises an antireflection film covering the light-emitting area, and the composite lens is formed on the surface of the antireflection film.~~

An amended Abstract is attached.
